ANTISTAT AMW-12

Online air ionizer
Static electricity is a nuisance, and a hazard, and attracts dirt!

Electrostatic charges may significantly interfere with various production processes and become rather troublesome. If the polarity of the charges differs, their attractive and repulsive forces not only affect the warp threads. They cause sheets of papers to cling together, feathers and fibres develop lumps and attract dirt particles from everywhere onto surfaces that should be clear and clean. Sudden discharges of highly charged coils, rollers, spools, bales or carts when touched accidentally are unpleasant and may trigger hazardous reactions.

The elimination of electrostatic charges is therefore indispensable for many production processes to ensure troublefree operation!

Electrostatic charges are created through friction and subsequent separation of two materials if their positive and negative charge carriers (ions) cannot be discharged from the respective object because it is non-conducting.

1. Generator
2. Ionizer 1
3. Ionizer 2 (only for thick products)

Electrically conducting air

Discharge must therefore create an electrically conducting bridge from the isolated charge carrier islands to the ground or general mains. Ionized air – that is, electrically conducting air – is ideal as such a bridge because it touches the charged islands everywhere and without fail.

The Antistat AMW generates such conducting air. High alternating voltage, applied through large series resistors to the needles of the ionizer rods, creates strong electrical fields around the needle tips. The molecules of the air are split (ionized) in the area of these fields; the air around the tips becomes conductive and can discharge the electrical charge from the charged object when reaching it.
TYPICAL APPLICATIONS

Three vital aspects

- The ionizer bars should be fixed so that they almost touch the surface of the material (no farther away than 20 mm).
- Heavyweight material may have to be discharged at both sides (see diagram below).
- Static can be generated again wherever there is friction or separation. It should be discharged, therefore, at that point where it is proving troublesome.

Ionizer bar

Typical applications

Winding

When winding fabric, especially in case of synthetic products, the materials may become electrostatically charged due to friction. Discharge is absolutely required to allow processing the product further without defect and hazard-free for the machine operator.

Plaiting unit, tucker

The product may continue becoming statically charged while running through the production line. To avoid risks for workers and damages to the material, the product should be discharged once more during plaiting. The ends of the swivel range are a suitable location, for example.

This is the case, for example, after the stenter. Double-sided discharge is required for heavy products.

2 ionizers at both ends of the swivel range
Warping machine

The warping machine is used to prepare loom beams for the weaving mill. During this process the fibres normally run through eyes or combs. There they become charged and can therefore repel one another. Fibre breaks or irregular entry into the shear rod are the result when the product is not discharged.

Sizing machine

When the product is sized, the threads become electrostatically charged while drying on drum driers or by rubbing against each other. Threads may tear as a result or run unevenly. Discharge immediately before the loom beam makes sure that the weft threads can be wound without problem.
For decades Mahlo® has been setting standards in the field of measuring and control systems for the textile industry: Using innovative and trend-setting technology.

In addition to the technology, direct contact with our customers is especially important to us. This includes intensive assistance and customer care wherever the customer is located and a global service and representative network including 24-hour replacement part service.

Mahlo customers can safely count on the know-how of our experts in any situation, whether installation and startup, conversion of existing systems or maintenance of their machines.
## TECHNICAL DATA

<table>
<thead>
<tr>
<th>Device</th>
<th>Antistat AMW</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Voltage Generator</strong></td>
<td></td>
</tr>
<tr>
<td>Version</td>
<td>High-tension transformer, totally enclosed in a block of hardened resin, and doubly protected by series-connected resistors. Impervious to heat</td>
</tr>
<tr>
<td>Outputs</td>
<td>Two 2 x 5 kV secondary outputs to feed up to a maximum of two 10 kV ioniser bars</td>
</tr>
<tr>
<td>Dimensions</td>
<td>210 mm x 150 mm x 130 mm</td>
</tr>
<tr>
<td>Weight</td>
<td>5.1 kg</td>
</tr>
<tr>
<td>Power supply</td>
<td>1 x 125 / 230 VAC</td>

PERSONALITY

You’re not just a number for us. Your individual needs and special requirements are our highest priority. We are there for you with our expertise, our leading technology and full dedication. So you can always play to win.
Monitoring and control systems, automation:

MAHLO GUARANTEES QUALITY. WORLDWIDE, IN YOUR VICINITY.

Best-possible technical support and know-how transfer are written in capital letters at Mahlo. Thanks to an international network of agencies and service centres, customers have at their disposal competent support worldwide. We are there for you 365 days a year, 24 hours a day. Just get in touch with us!
